Education

University of Maryland, College Park **Expected: May 2027**
B.S. in Computer Science & B.S. in Biological Sciences **GPA: 3.8/4.0**

Relevant Coursework: Algorithms, Advanced Data Structures, Object-Oriented Programming, Computer Systems, Computer Networks, Compilers, Database Design, Programming Handheld Systems, Data Science, Machine Learning, Linear Algebra, Applied Probability and Statistics

Technical Skills

Languages: Python, Kotlin, Java, C, R, JavaScript, TypeScript, HTML/CSS, SQL, MATLAB, Assembly
Frameworks & Libraries: React, React Native, Svelte, Django, Node.js, pandas, scikit-learn, NumPy, SciPy
Developer Tools & Databases: Git, Unix/Linux CLI, Docker, R Studio, PostgreSql
AI Tools: Claude Code, Codex CLI, Rovo Dev

Experience

Software Engineer Intern May 2026 – August 2026
Atlassian *San Francisco, CA*

- Orchestrated an end-to-end multi-codebase migration of Analytics notifications from an isolated legacy system to a centralized platform, implementing **Python** dual-writes and **React** updates to seamlessly transition **16k+** MAU.
- Consolidated email and in-app pipelines into a unified event publisher using a single backend payload schema, eliminating duplicate logic and enabling integration across **3** platforms in the newly launched Insights app.
- Sequenced a staged dogfood-to-GA rollout across **3** apps via **10** feature flags and authored deployment runbooks.
- Diagnosed and resolved styling conflicts that escaped local testing, preventing cross-product UI regressions.
- Independently pitched and engineered notification grouping and channel filtering ahead of target timeline.

Undergraduate Research Assistant September 2026 – Present
Pierce Lab, Institute for Bioscience & Biotechnology Research *College Park, MD*

- Refactored a legacy Perl bioinformatics pipeline into a modular **Python** architecture, automating candidate selection and validation across updated PDB and SAbDab structural datasets.
- Integrated BLAST sequence alignment and structural filtering to identify novel antibody–peptide complexes, automating candidate annotation and streamlining manual curation of **41** benchmark structures.
- Conducted manual inspection of antibody–peptide complexes in PyMOL to assess candidate eligibility.

Software Engineer Intern May 2025 – August 2025
Solom *Remote*

- Architected the Biodiversity Dashboard MVP with interactive data visualizations for biodiversity metrics and compliance tracking, establishing the core data-reporting foundation for Solom's B2B risk management platform.
- Spearheaded a migration from **React** to **Svelte**, cutting initial page load time by **300**ms and slashing bundle size.
- Automated KPI verification checks and alert pipelines, eliminating manual review and preventing reporting errors.
- Provisioned role-based authentication using Supabase and **PostgreSQL**, securing multi-tenant client permissions.

Projects

Kompass | *React, Atlassian REST APIs* July 2026

- Shipped a role-aware onboarding hub in 9 hours at Atlassian ShipIt, placing **10th** in People's Choice by aggregating Confluence spaces, Jira boards, and Bitbucket repos via **REST APIs** to surface team resources in seconds.
- Integrated the Teamwork Graph API to auto-discover and map cross-functional team resources and collaborators.
- Built an interactive **React** infinite-canvas interface to visualize team resources by recency, speeding up ramp time.

HallHopper | *Python (Flask), React Native* April 2025

- Developed a cross-platform **React Native** mobile application to help students navigate interconnected campus buildings indoors, reducing outdoor exposure and improving campus accessibility during inclement weather.
- Engineered a **Flask** RESTful API to parse JSON building floorplans and deliver optimized indoor routing paths.
